## The Phoenix HOMELIFT Difference

### The lift for your home

If you are looking for an efficient lift solution that takes up little space, is easy to install and increases the property's value we are delighted to offer you simply the best solution on the market. The **HOMELIFT** is a stylish residential lift suitable for all kinds of different environments and it offers freedom of movement within the house to those whom stairs represent an insurmountable obstacle also "FUTURE PROOFING" the home.

In most existing buildings where lack of space limits or rules out normal pit depth or headroom, the straight forward solution is the **HOMELIFT** which can be installed both indoors or outdoors.

**Design** – The fully enclosed lift car travels on machined guide rails mounted to either a side or rear wall, the car can have entrances on up to 3 sides and travel up to 14m allowing complete freedom of design by the Architect

**Safety** – The safety features supplied as standard with the **HOMELIFT** are carefully designed to make it safe and reliable equipped with safety ensured by an infra-red safety scanner which is optically activated and brings the lift car to a smooth stop on detection of the slightest movement within that area which also means there is no chance of entrapment between the lift car and shaft as exists with moving floor platform lifts. The drive system is fitted with safety brakes and over speed devices, designed with all the safety functions of commercial lifts. In the event of power failure the lift automatically descends to the lower floor unlocking the landing door, all landing doors are fitted with safety interlocks stopping the landing door opening unless the lift is at the landing

**Construction** – The design does not require a deep bore hole under the lift as it runs on side mounted guides. It does not rely on friction to stabilise the lift floor nor does it require expensive finishes to the lift shaft, a pit of 200mm is all that is required.

**Low Headroom** – The design is such that the lift will fit under a normal roof line or ceiling height, this means no expensive roof "pop-ups"

**Customized** – The lifts are made in **New Zealand** allowing us to "adapt" to suit your space, the design is very flexible, lift car finishes can be fully customised in almost any material including special stainless steel finishes and glass.

**Installation** – We undertake installation throughout New Zealand, Australia and the Pacific Islands, maintenance is undertaken by our own specialised maintenance division
